Question 1: Multiple Choice Completely fill in t question should have exactly one filled-in bubble.	ne bubble next to your answer using a pencil. Each
1.1. A variable's value should not be reassigned after initialization.TrueFalse	1.8. When accessing an index of a list that does not exist, what kind of error is encountered? NameError
1.2. Which of the following refers to the first time a variable is bound to a value?Assignment	<pre></pre>
 Assignment Initialization Relative Reassignment Declaration 	1.9. When accessing an element of a list, what kind of value most generically describes what is found inside the subscription notation's square brackets. E.g. a_list[HERE]
1.3. Which side of the following statement should be evaluated first?1 x = y	○ Integer Literal○ Data Type○ Integer Expression
	O Integer Variable Name
x (left-hand side)y (right-hand side)	1.10. Generally, to avoid an infinite while loop, each iteration of the loop body should change a variable involved in the while
1.4. The following two statements are equiva- lent to one another and interchangeable:	loop's test condition bringing it closer to False:
$ \begin{array}{cccc} 1 & x & = & y \\ 2 & y & = & x \end{array} $	○ False○ True
<pre> False True</pre>	1.11. Consider a function named f with a while loop. In the while loop's body, there is a return statement. At most, how many
1.5. The following statement increments \mathbf{x} 's value by 1 .	times will this return statement be evaluated in a single function call to f ?
1 x + 1 = x	○ 1○ As many times as the loop iter-
○ False ○ True	ates (Infinite
1.6. The following statement increments x's value by 1.	1.12. Which of the following describes a test written to demonstrate an expected usage of a function?
1 x += 1	○ Edge Case
() False	○ Use Case
○ True	1.13. What is the evaluation of the following expression:
1.7. The following statement increments x 's value by 1.	1 [10, 20, 30][[0, 1, 2][3 - 1]]
$1 \boxed{x = x + 1}$	$ \bigcirc 10 \\ \bigcirc 20 $
○ False	
○ True	\bigcirc IndexError

Question 2: Respond to the following questions

Consider the following code listing:

```
animals: list[str] = ["fox", "bear", "rabbit"]
ints: list[int] = [1, 1, 1, 1]
two_d: list[list[int]] = [[10, 20], [30, 40], [50, 60]]
2.1. Write an expression that evaluates to "bear", making use of the animals variable.
2.2. Write a method call that adds the value "mouse" to the animals list.
2.3. Write a function call expression that evaluates to the quantity of values in the animal list.
2.4. Write an expression that increments the 3rd value in ints to be one greater than its previous
     value (regardless of what the previous value was).
2.5. Write a sequence of 3 assignment statements that will swap the values of the 0 and 1 index in
     animals. You will need to declare and initialize a temporary variable.
2.6. Write an expression that accesses the value 40 stored in the two_d variable.
2.7. Write an expression that accesses the list [50, 60] stored in the two_d variable.
2.8. Write an expression that removes the item at index 1 from animals.
```

Question 3: Memory Diagram Trace a memory diagram of the following code listing.

```
def mutator(x: int, exes: list[int]) -> int:
1
2
     """An impure function..."""
3
     x += 1
4
     exes[0] += 1
5
     y: int = x + 1
6
     print(f"mutator x: \{x\}, exes: \{exes\}, y: \{y\}")
7
     return x
8
9
10 | x: int = 0
11 | exes: list[int] = [0]
12 | y: int = 0
13 | print(f"global before x: \{x\}, exes: \{exes\}, y: \{y\}")
14 \mid y = mutator(x, exes) + 2
15 print(f"global after x: {x}, exes: {exes}, y: {y}")
```

O.	utput				

	Stack		Heap
Globals			

Question 4: Memory Diagram Trace a memory diagram of the following code listing.

```
def loopy(foods: list[str]) -> list[str]:
1
2
     index: int = len(foods) - 1
3
     while index >= 0:
4
       print(foods[index])
5
       foods.pop(index)
6
       index -= 2
7
     foods.append("papaya")
8
     return foods
9
10
11 # Example usage:
12 words: list[str] = ["apple", "banana", "cherry", "date"]
13 | print(words)
14 loopy (words)
15 | print(words)
   Output
```

Output		
Stack	Неар	
Clobals		

	Stack	
Globals		

Question 5: Memory Diagram Trace a memory diagram of the following code listing.

```
def combine(ayes: list[int], bees: list[int]) -> list[int]:
1
     """Add the items of two lists item-wise."""
2
     assert len(ayes) == len(bees)
3
4
     idx: int = 0
     result: list[int] = []
5
     while idx < len(ayes):
6
7
       result.append(ayes[idx] + bees[idx])
8
       idx += 1
9
     return result
10
11
12 odds: list[int] = [1, 3, 5]
13 | evens: list[int] = [2, 4, 6]
14 | totals: list[int] = combine(odds, evens)
15 | print(totals)
```

Output	,
--------	---

Stack	Heap	
Globals		

Question 6: Memory Diagram Trace a memory diagram of the following code listing and then answer the sub-questions. You do not need to diagram the sub-questions.

```
1
   def sum2d(xs: list[list[int]]) -> int:
2
     """Calculate the sum of a 2-dimensional list of lists."""
3
     total: int = 0
     row_i: int = 0
4
5
     while row_i < len(xs):
6
       col_i: int = 0
7
       while col_i < len(xs[row_i]):</pre>
         total += xs[row_i][col_i]
8
9
         col_i += 1
10
       row_i += 1
11
     return total
12
13
   values: list[list[int]] = [
14
15
     [1, 2, 3],
     [3, 4, 5],
16
17
     [7, 8, 9]
18 ]
19
  print(sum2d(values))
```

Output

Stack Heap Globals			
GIODAIS		Heap	
	Hobals		

Question 7: Memory Diagram Trace a memory diagram of the following code listing.

```
def mul_table(height: int, width: int) -> list[list[int]]:
1
2
     """Generate a multiplication table."""
3
     table: list[list[int]] = []
4
     row_idx: int = 1
     while row_idx <= height:</pre>
5
       col_idx: int = 1
6
7
       row: list[int] = []
8
       while col_idx <= width:</pre>
9
        row.append(row_idx * col_idx)
10
         col_idx += 1
       table.append(row)
11
12
       row_idx += 1
13
     return table
14
15
16 | print(mul_table(3, 3))
```

Output

Stack	Heap	
Globals		

Question 8: CHALLENGE Memory Diagram Trace a memory diagram of the following code listing.

```
def sort(xs: list[int]) -> None:
1
2
     """Sort with the insertion sort algorithm."""
     N: int = len(xs) # Number of items
3
4
     idx: int = 1 # "current index"
5
     x: int # "current value"
     si: int # "shift index" searching backward
6
7
     while idx < N:
8
       print(xs)
9
10
       x = xs[idx] # store current value
       si = idx
11
12
       while si > 0 and x < xs[si - 1]:
13
         xs[si] = xs[si - 1] # shift greater value forward one
14
15
       xs[si] = x # *insert* (assign) "current value" in correct position
16
       idx += 1
17
18
19 | values: list[int] = [40, 10, 30, 20]
20 | sort(values)
21 | print(values)
```

Output		
Stack	Heap	

Question 9: Function Writing Write a function definition for reverse with the following expectations:

- The reverse function should accept a list[str] parameter and return a list[str].
- The returned list should have every item of the parameter list in reversed order, such that the first value of the returned list was the last value of the input list, the second value of the returned list was the second to last value of the input list, and so on.
- The function *must not mutate* its parameter.
- The function *must not use* the copy, reverse, or insert methods of list.
- You should explicitly type all variables, parameters, and return types.

Write a test values in the	function for a list.	use case tha	at demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	t demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	t demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	at demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	nt demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	at demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	t demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	t demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	t demonstra	tes expected	usage with	at least th
Write a test values in the	function for a list.	use case tha	at demonstra	tes expected	usage with	at least th

Question 10: CHALLENGE Function Writing Write a function definition for flip_flop with the following expectations:

- The flip_flop function should accept a list[str] parameter and return None.
- The function *must mutate* its parameter such that pairs of subsequent indices are swapped. For example, index 0's value should be swapped with index 1's value. Index 2's value should be swapped with index 3's value, and so on. If there are an odd number of indices, leave the final element in its place.
- You should explicitly type all variables, parameters, and return types.

10.1.	Write your function definition for flip_flop here.
10.2.	Write a test function for a use case that demonstrates expected usage with at least three values in the list.
